

Customer information

Save energy, space and time with SENNING!

Do you already know the advantages of the PACDrive 3 control system from Schneider Electric?

Save Energy

The DC link coupling of the servo amplifiers and the power supplies, as well as their generous equipment with storage capacity, allow an optimized utilization of accruing energy.

Save Space

The system design, with central power supply unit and bridged DC link, results in considerable space savings in the control cabinet.

Save Time

The Plug&Play technology automatically configures changed assemblies, or motors.

Save Cost

ILM servo drives, with integrated controller electronics, require only one power unit in the control cabinet. This results in significantly less heat in the control cabinet, which reduces the need for air conditioning and thus energy consumption.
